Trace Preset

A built-in starting point (Black and White Logo, High Fidelity Photo, 3 Colors, Line Art) that sets sensible defaults for your kind of source image.

Ignore White

Treats white areas of the source as transparent instead of tracing them as opaque shapes — useful for a logo on a colored background.

Threshold

In Black and White mode, the brightness value (0–255) deciding whether a pixel becomes black or white. Raise it to convert more midtones to black.

Paths / Corners / Noise

Fine-tuning sliders: Paths controls how tightly the trace follows the original edge, Corners how sharp turns stay, Noise how small a speck is ignored.

Expand

Converts the live trace into real, editable vector paths. Before expanding, it's just a preview linked to the placed raster image.

A live trace isn't finished artwork — you can't select or edit its individual paths until you click Expand.
