

bins • Program Monitor • project settings • Properties panel • scratch disks • sequence preset • Source Monitor • timecode

1. When you create a new Premiere project, you choose its _____ and confirm your _____ point to a fast drive with room to spare — not your computer's main OS drive.
2. A _____ is a pre-built set of sequence settings matching a common camera format. Your sequence should always be set up to match your footage, not the other way around.
3. The _____ shows a raw clip before it's been edited in, while the _____ shows the sequence exactly as it will play back.
4. Every clip and sequence is organized into _____ inside the Project panel — like the trim bins used to sort film reels before computers existed.
5. Not sure of a clip's specs? Check the _____ — it shows the technical metadata (frame rate, resolution, codec) of whatever's selected.
6. A frame-accurate address like 00:01:23:12 is called _____ — how editors reference an exact moment precisely.

Discuss: You're handed a hard drive of 50 unsorted clips. What bin structure would you build before touching the timeline, and why?
