

eye-level • focus • headroom • medium close-up • tripod • white balance

1. A _____ provides stable support for the camera — no handheld shots for a news package.
2. The camera should be at your subject's _____, not angled up or down at them.
3. Your subject should fill most of the frame in a _____, with just enough _____ — not too much, not too little.
4. Before you roll, always check _____ (so colors render correctly) and _____ (so the shot is sharp).

Discuss: You review your footage and the subject's eyes are right at the very top of the frame with almost no headroom. What would you fix before the real shoot?
